

Assignment 0: Setup

Introduction: This assignment helps you set up the lab work for the course PA1417 Basic System Verification. While its completion will not count towards the final grade of this course, working on the assignment is highly recommended. In case of questions, please contact Zeth Danielsson (zeda21@student.bth.se).

1. Group Work

All labs have to be submitted in groups of two. *Form and declare teams in the People section of the Canvas course page.* Feel free to use the `finding-lab-partners` channel on Discord to find a partner.

Deliverables: The submission to this exercise must contain all of the following:

1. The names of the two team members.
2. The group number to which the team is assigned on Canvas.

2. Testing System

Starting from assignment 2, you will use a testing system to apply the techniques you have learned in the lectures and tutorials. We will use a toy system you can find at <https://github.com/bth-dipt-teaching/bsv-edutask>. *Fork the toy system for your lab work.* It is not yet necessary to get the system running on your local machine, though encouraged and recommended. Feel free to use the `edutask-tech-support` channel on Discord to troubleshoot the setup.

Deliverables: The submission to this exercise must contain all of the following:

1. A link to the fork of the edutask repository.
2. A screenshot showing that both team members are collaborators in the repository.
